Widely adopted as a textbook, the book has its origins in a popular entry-level computer science course taught by Harold Abelson and Gerald Jay Sussman at MIT. Since the publication of its first edition in 1984 and its second edition in 1996, Structure and Interpretation of Computer Programs (SICP) has influenced computer science curricula around the world. Chapter four offers new material, in particular an introduction to the notion of program parsing. SICP introduces the reader to central ideas of computation by establishing a series of mental models for computation. Chapters four and five, which used Scheme to formulate language processors for Scheme, required significant revision. This new version of the second edition has been adapted for JavaScript. The evaluator and compiler in chapter five introduce a subtle stack discipline to support return statements (a prominent

feature of statement-oriented languages) without sacrificing tail recursion. The JavaScript programs included in the book run in any implementation of the language that complies with the ECMAScript 2020 specification, using the JavaScript package `sicp` provided by the MIT Press website. The first three chapters of SICP cover programming concepts that are common to all modern high-level programming languages. Earlier editions used the programming language Scheme in their program examples. A new version of the classic and widely used text adapted for the JavaScript programming language `c8e9454fc0`
