Mood Disorder Questionnaire (MDQ) is a self-report questionnaire designed to help detect bipolar disorder. The MDQ has become one of the most widely studied and used questionnaires for. It takes approximately 5–10 minutes to complete. The MDQ was originally tested with adults, but it also has been studied in adolescents ages 11 years and above. It focuses on symptoms of hypomania and mania, which are the mood states that separate bipolar disorders from other types of depression and mood disorder. In 2006, a parent-report version was created to allow for assessment of bipolar symptoms in children or adolescents from a caregiver perspective, with the research looking at youths as young as 5 years old. Other rating scales are more useful for measuring severity and treatment outcomes 3cc3b8369d

Depersonalization-derealization disorder Derealization is described as detachment from one's surroundings. Depersonalization is described as feeling disconnected or detached from one's self. Individuals may report feeling as if they are an outside observer of their own thoughts or body, and often report feeling a loss of control over their thoughts or actions. Individuals experiencing derealization may report perceiving the world around them as foggy, dreamlike, surreal, and/or visually distorted. with smaller episodes of lesser severity that become gradually more intense and

more disabling. Some patients report persistent depersonalization and/or Depersonalization-derealization disorder (DPDR, DDD) is a mental disorder in which the person has persistent or recurrent feelings of depersonalization and/or derealization 3cc3b8369d

Criminal Justice Act 2003 Large portions of the act were repealed and replaced by the Sentencing Act 2020. 44) is an Act of the Parliament of the United Kingdom. sample of the deeply confusing provisions of the Criminal Justice Act 2003, and the satellite statutory instruments to which it is giving stuttering birth The Criminal Justice Act 2003 (c. It is a wide-ranging measure introduced to modernise many areas of the criminal justice system in England and Wales and, to a lesser extent, in Scotland and Northern Ireland 3cc3b8369d

Rating scales for depression When used, an observer may make judgements and rate a person at a specified scale level with respect to identified characteristics. When used, an observer may make judgements A depression rating scale is a psychometric instrument (tool), usually a questionnaire whose wording has been validated with experimental evidence, having descriptive words and phrases that indicate the severity of depression for a time period. Several rating scales are used for this

purpose. experimental evidence, having descriptive words and phrases that indicate the severity of depression for a time period. Rather than being used to diagnose depression, a depression rating scale may be used to assign a score to a person's behaviour where that score may be used to determine whether that person should be evaluated more thoroughly for a depressive disorder diagnosis

It amends the law relating to police powers, bail, disclosure, allocation of criminal offences, prosecution appeals, autrefois acquit ("double jeopardy"), hearsay, propensity evidence, bad character evidence, sentencing and release on licence. It permits offences to be tried by a judge sitting alone

without a jury, in cases where there is a danger of jury-tampering. It also expands the circumstances in which defendants can be tried twice for the same offence... 3cc3b8369d Most people who experience... 3cc3b8369d

Post-traumatic stress disorder These symptoms last for more than a month after the event and can include triggers such as misophonia. There are also several screening and assessment instruments for use with children Post-traumatic stress disorder (PTSD) is a mental disorder that develops from experiencing a traumatic event, such as sexual assault, domestic violence, child abuse, warfare and its associated traumas, natural disaster, bereavement, traffic collision, or other threats on a person's life or well-being. Young children are less likely to show distress, but instead may express their memories through play. Symptoms may include disturbing thoughts, feelings, or dreams related to the events, mental or physical distress to trauma-related cues, attempts to avoid trauma-related cues, alterations in the way a person thinks and feels, and an increase in the fight-or-flight response. of monitoring the severity of symptoms and the response to treatment 3cc3b8369d

Voice therapy both speech and voice production. Voice therapy may also serve to teach preventive measures such as vocal hygiene and other safe speaking or singing practices. This technique can be used to treat stuttering, breathing, dysprosody, dysphonia, and to increase control of breathing. Voice therapy consists of techniques and procedures that target vocal parameters, such as vocal fold closure, pitch, volume, and quality. Vocal pedagogy is a related field to alter voice for the purpose of singing. This therapy is provided by speech-language pathologists and is primarily used to aid in the management of voice disorders, or for altering the overall quality of voice, as in the case of transgender voice therapy 3cc3b8369d

General Behavior Inventory It is one of the most widely used psychometric tests for measuring the severity of bipolar disorder and the fluctuation of symptoms over time. The GBI is intended to be administered for adult populations; however, it has been adapted into versions that allow for juvenile populations (for parents to rate their offspring), as well as a short version that allows for it to be used as a screening test. psychological self-report assessment tool designed by Richard Depue[failed verification] and colleagues to identify the presence and severity of manic and depressive The General Behavior Inventory (GBI) is a 73-question psychological self-report assessment tool

designed by Richard Depue and colleagues to identify the presence and severity of manic and depressive moods in adults, as well as to assess for cyclothymia 3cc3b8369d

Hypomania Checklist More recent work has focused on validating translations and testing whether shorter versions still perform well enough to be helpful clinically. bipolar disorder focused on identifying personality factors and symptom severity instead of the episodic nature of hypomania or the possible negative consequences The Hypomania Checklist (HCL-32) is a questionnaire developed by Dr. Jules Angst to identify hypomanic features in patients with major depressive disorder in order to help recognize bipolar II disorder and other bipolar spectrum disorders when people seek help in primary care and other general medical settings. It asks about 32 behaviors and mental states that are either aspects of hypomania or features associated with mood disorders. The University of Zurich holds the copyright, and the HCL-32 is available for use at no charge. Recent meta-analyses find that it is one of the most accurate. It uses short phrases and simple language, making it easy to read 3cc3b8369d

Asperger syndrome Asperger syndrome has been merged with other conditions into autism spectrum disorder (ASD) and is no longer a diagnosis in the WHO's ICD-11 or the APA's DSM-5-TR. It was considered milder than other diagnoses which were merged into ASD due to relatively unimpaired spoken language and intelligence. Journal of Autism and Developmental Disorders Asperger syndrome (AS), also known as Asperger's syndrome or Asperger's, is a diagnostic label that has historically been used to describe a neurodevelopmental disorder characterized by significant difficulties in social interaction and nonverbal communication, along with restricted, repetitive patterns of behavior and interests. "The autism diagnostic observation schedule, module 4: revised algorithm and standardized severity scores" 3cc3b8369d
