Cryptanalysis of the Enigma Hugh (2000), Enigma: The Battle for the Code, New York: John Wiley, ISBN 0-471-40738-0 Sebag-Montefiore, Hugh (2004) [2000], Enigma: The Battle for the Cryptanalysis of the Enigma ciphering system enabled the western Allies in World War II to read substantial amounts of Morse-coded radio communications of the Axis powers that had been enciphered using Enigma machines. This yielded military intelligence which, along with that from other decrypted Axis radio and teleprinter transmissions, was given the codename Ultra 49

During the German invasion of Poland in September 1939, Ci??ki escaped to France to continue work on breaking Enigma ciphers. In 1943 he was captured by the Germans and interned in an S.S. concentration camp. 49 The cipher had two stages: a transposition followed by bigram substitution. In the transposition stage, the cipher clerk would write out the plaintext into a "cage" — a shape on a piece of paper. Pairs of letters were then substituted using a set of bigram tables. 49

The Reservehandverfahren cipher was first solved at Bletchley Park in June 1941 by means of documents captured from U-boat U-110 the previous month. Thereafter it was solved using cryptanalysis for over three years. Some 1,400 signals were read during that period. The section working on RHV was headed by historian Sir John H. Plumb. The decrypts
