

Bender Gestalt Scoring Manual

British Columbia Postconcussion Symptom Inventory (ICD-10;(World Health Organization, 1992) and the Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition (DSM-IV;(American Psychiatric Association The British Columbia Postconcussion Symptom Inventory (BC-PSI), is a 16 item self-report inventory designed to measure both the frequency, and intensity of the ICD-10 criteria for Post concussion syndrome, which is a common occurrence in cases of mild traumatic brain injury. The (BC-PSI) asks the respondent to rate the severity of 13 symptoms rated on a six-point Likert-type rating scale that measures the frequency and intensity of each symptom in the past two weeks c83e8c9bfa

Rey–Osterrieth complex figure First proposed by Swiss psychologist André Rey in 1941 and further standardized by Paul-Alexandre Osterrieth in 1944, it is frequently used to further explain any secondary effect of brain injury in neurological patients, to test for the presence of dementia, or to study the degree of cognitive development in children. Many different cognitive abilities are needed for a correct performance, and the test therefore permits the evaluation of different functions, such as visuospatial abilities, memory, attention, planning, working memory and (executive functions). of whether or not children had developed the concept of a holistic or gestalt principle by various ages, as manifested by the way they approached the The Rey–Osterrieth complex figure (ROCF) is a neuropsychological assessment in which examinees are asked to reproduce a complicated line drawing, first by copying it freehand (recognition), and then drawing from memory (recall) c83e8c9bfa

Boston Naming Test Items are rank ordered in terms of their ability to be named, which is correlated with their frequency. Patients with anomia often have greater difficulties with the naming of not only difficult and low frequency objects but also easy and high frequency objects. The BNT contains 60 line drawings graded in difficulty. Naming difficulties may be rank ordered along a continuum. A common and debilitating feature is anomia, an impairment in the ability to name objects. in the Test Manual. After the patient completes the test, the examiner scores each item + or – according to the response coding and scoring procedures The Boston Naming Test (BNT), introduced in 1983 by Edith Kaplan, Harold Goodglass and Sandra Weintraub, is a widely used neuropsychological

assessment tool to measure confrontational word retrieval in individuals with aphasia or other language disturbance caused by stroke, Alzheimer's disease, or other dementing disorder c83e8c9bfa

Continuous performance task Correct Detection: This indicates A continuous performance task, continuous performance test, or CPT, is any of several kinds of neuropsychological test that measures a person's sustained and selective attention. higher functioning or adult populations. While scoring varies from test to test, there are four main scores that are used. Sustained attention is the ability to maintain a consistent focus on some continuous activity or stimuli, and is associated with impulsivity. This skill is associated with distractibility. Selective attention is the ability to focus on relevant stimuli and ignore competing stimuli c83e8c9bfa

Pediatric Attention Disorders Diagnostic Screener The PADDs is used in the diagnosis of attention deficit hyperactivity disorder (ADHD) in children between the ages of 6 and 12 years. It calculates a diagnostic likelihood ratio, where each data source is allowed to contribute. across the 18 core diagnostic items from the Diagnostic and Statistical Manual of Mental Disorders DSM-IV Fourth Edition-Revised. Pedigo and Kenneth L. Thomas K. The PADDs software program represents a multi-dimensional, evidence-based approach to ADHD assessment, consisting of the Computer Administered Diagnostic Interview (CADI), the Swanson, Nolan, and Pelham—IV (SNAP-IV) Parent and Teacher rating scales, and the three computer-administered objective measures of the Target Tests of Executive Functioning (TTEF). Pedigo, is a suite of computer administered neuropsychological tests of attention and executive functioning. Each item is rated on The Pediatric Attention Disorders Diagnostic Screener (PADDs), created by Dr c83e8c9bfa

The NART was developed by Hazel Nelson in the 1980s in Britain and published in 1982. The test comprises 50 written words in British English which all have irregular spellings (e.g. "aisle"), so as to test the participant's vocabulary rather than their ability to apply regular pronunciation rules. The manual includes equations for converting NART scores to predicted IQ scores on the Wechsler Adult Intelligence Scale... c83e8c9bfa

Boston Diagnostic Aphasia Examination There are five subtests which include: conversational & expository speech, auditory comprehension, oral expression, reading, and writing. In the extended version all questions are asked while in the. The exam evaluates language skills based on perceptual modalities (auditory, visual, and gestural), processing functions (comprehension, analysis, problem-solving), and response modalities (writing, articulation, and manipulation). The manual provides clear statements and rules for scoring protocols. Administration time ranges from 20 to 45 minutes for the shortened version but it can last up to 120 minutes for the extended version of the assessment. Once the scores are collected, the examiner completes the Summary of Scores and The Boston Diagnostic

Aphasia Examination is a neuropsychological battery used to evaluate adults suspected of having aphasia, and is currently in its third edition. It was created by Harold Goodglass and Edith Kaplan c83e8c9bfa

Frequency ratings range from 0 = “not at all” to 5 = “constantly”. c83e8c9bfa There are a variety of CPTs, the more commonly used being the Integrated Visual and Auditory CPT (IVA-2), Test of Variables of Attention (T.O.V.A.) and the Conners' CPT-III. These attention tests are often used as part of a battery of tests to understand a person's 'executive functioning' or their capacity to sort and manage information... c83e8c9bfa

Benton Visual Retention Test The test is untimed, and the results are professionally scored by form, shape, pattern, and arrangement on the paper. professionally scored by form, shape, pattern, and arrangement on the paper. Arthur Benton was a psychologist who worked with neurologist Morris Bender during The Benton Visual Retention Test (or simply Benton test or BVRT) is an individually administered test for people aged from eight years to adulthood that measures visual perception and visual memory. The individual examined is shown ten designs, one at a time, and asked to reproduce each one as exactly as possible on plain paper from memory. It can also be used to help identify possible learning disabilities among other conditions that might affect an individual's memory c83e8c9bfa

National Adult Reading Test Such tests are called hold tests as these abilities are thought to be spared, or "held" following neurological injury or decline. The manual includes equations for converting NART scores to predicted IQ scores on the Wechsler Adult Intelligence Scale The National Adult Reading Test (NART) is a widely accepted and commonly used method in clinical settings for estimating premorbid intelligence levels of (initially) English-speaking patients with dementia in neuropsychological research and practice. apply regular pronunciation rules c83e8c9bfa

Vineland Social Maturity Scale American psychologist Edgar Arnold Doll and published in 1940. Doll named it after the Vineland Training School for the The Vineland Social Maturity Scale is a psychometric assessment instrument designed to help in the assessment of social competence. Doll named it after the Vineland Training School for the Mentally Retarded, where he developed it. It was developed by the American psychologist Edgar Arnold Doll and published in 1940. He published a manual for it in 1953. He published a manual for it in 1953 c83e8c9bfa

Delis–Kaplan Executive Function System As such, use of the computerized scoring assistant (available The Delis–Kaplan Executive Function System (D-KEFS) is a neuropsychological test used to measure a variety of verbal and nonverbal executive functions for both children and adults (ages 8–89 years). , the Trail Making Test); however, some of these measures are new indices of executive functions (e. This assessment was developed over the span of a decade by Dean Delis, Edith Kaplan, and Joel Kramer, and it was published in 2001. , Word Context Test). A vast majority of these tests are modified, pre-existing measures (e. achievement scores and hundreds of optional error, contrast, accuracy, and time-interval scores. g. The D-KEFS comprises nine tests that were designed to stand alone. Therefore, there are no aggregate measures or composite scores for an examinee's performance. g c83e8c9bfa

Intensity ratings range from 0 = “not at all” to 5 = “very severe problem”. c83e8c9bfa The two ratings are multiplied (how often × how bad) to create a single score for each item. These product-based scores are then converted to item scores that reflect both the frequency... c83e8c9bfa
